

## Week 7 Research Assignment

**What are 3 HTML elements not mentioned any of the video this week? What do they do and how are they used?**

One element not mentioned is `<pre>`. This element is used to display text that has already been formatted in the html. The browser displays the text within this element just how it is written, including any blank areas. This is used for when the format of the text is important for the meaning of the text. Another element is `<iframe>` which represents placing an html file into another html file. An example would be embedding a video onto a webpage. The element `<menu>` is basically the same as the `<ul>`, which is an unordered list. This can be used to list out items in no particular order.

**Choose one of your favorite websites and identify 5 different HTML elements used on the website. Make sure to include the URL in your submission.**

One element that I found was `<img src= >`. This element is being used to display multiple images on the site by using the image URL. Another element is `<ol>` to indicate an ordered list. Below the `<ol>` element, there were also numerous elements for `<li>` to denote the list items. The site is also using the element `<header id>`. This is used to assign an identifier to the header so JavaScript can access it. The element `<div id>` is also used. This one is similar to the `< header id>`, except this one assigns an element to the section.
